

PUBH 852 : Environmental Health Management

Environmental Health Management is designed to prepare students to confidently step into community situations in a professional capacity and experience, understand, evaluate, and solve real-world environmental and occupational health issues in the developing world. Emphasis will be placed on understanding the linkages between the physical and social aspects of environmental and occupational health issues. Topics are variable and will draw upon the cumulative expertise of the Environmental Health Track faculty. Course time will be split approximately evenly between field project time conducted off-campus and in-class instruction designed to prepare students for field projects.

Core Course
